Abstract (en)

The system has an image sensor (101), readout electronics and a controller (35) for configuring at least one gain so that a boundary charge value is a small first charge value, binary numbers are received by the readout electronics representing an image detected by the image sensor and the gain is readjusted so the boundary charge value is higher than for the preceding setting if at least one binary number represents a charge value above a maximum value in a repeating process. An independent claim is also included for a method of recording a series of fluorescence images using a camera system.
