Abstract (en)

[origin: WO2006018561A1] The invention relates to a traversing device (5) characterized by comprising at least one first part (13) joined to a framework element of a winder (1) and comprising at least one second part (12) comprising means for depositing and guiding at least one yarn (7), said first part (13) and second part (12) being joined to one another in such a manner that the second part (12) occupies a first position called the working position in which the yarn can be deposited in the form of a bobbin and occupies a second position in which the second part (12) is separated from the first part (13) corresponding to a maintenance phase of the second part (12).
