Abstract (en)

[origin: WO2006131783A2] Novel markers for lung cancer that are both sensitive and accurate. These markers are overexpressed in lung cancer specifically, as opposed to normal lung tissue. The measurement of these markers, alone or in combination, in patient samples provides information that the diagnostician can correlate with a probable diagnosis of lung cancer. The markers of the present invention, alone or in combination, show a high degree of differential detection between lung cancer and non-cancerous states.
