Abstract (en)
[origin: WO2006018509A1] The invention relates to a surveillance system wherein a localisation terminal TL and a surveillance terminal co-operate. Each terminal TL comprises: means for the acquisition R1 L of a localisation message; communication means MRL-ARL adapted to a communication channel; and control means MCL for connecting the acquisition means and the communication means in response to an activation signal. Furthermore, the activation signal coincides with a pre-determined interval of a repetitive frame of said communication channel.
