Abstract (en)  
The unit has a roller operated locking unit that is wound on a sleeve cylinder (12), where the cylinder is mounted at a fixed frame using a wandering support. A locking lever (20) is attached to the cylinder and is rotatable with the cylinder. An anchor plate (24) is fixedly attached to the frame or to the perimeter of a building opening. The locking lever and the anchor plate are formed in such a manner that the locking lever is engaged into the anchor plate in an end phase of locking movement of the locking unit and prevents movement of the cylinder with respect to the opening.
