Abstract (en)
[origin: EP1775471A1] A compressor is provided as a compact unit while effectively preventing coolant leakage and assuring safety by optimizing the contact pressure at a seal member held between a plurality of housing members so as to minimize the size or the number of fastening members. In the compressor comprising at least two housing members, in which the compression mechanism is housed, a seal member held between the housing members and fastening members used to fasten the housing members and the seal members as one, a contact pressure applied to the seal members as the housing member and the seal members are fastened together via the fastening members is set within a range over which the critical seal pressure of the seal member is higher than the maximum operating pressure of the compressor and lower than the breaking pressure of the compressor.
