Abstract (en)

The connector has a connection part with inner and outer housing parts (10,20). The housing part has two stopper units (19a,19b), which fix the housing parts to one another in the pre resting position. Another stopper unit (22) is disengaged from the pre-resting position in the completely wrapped condition of the connector so that the outer housing is displaceable from the inner housing part in the final resting position. An independent claim is also included for a housing part for use in the connection part of a connector.
