Abstract (en)

[origin: EP1777171A2] The packaging has at least two elements (10, 20) connected together for swivel movement between two or more swivel positions so that in the second swivel position the elements have a smaller swivel angle relative to each other than in the first position but define a space to hold the equipment which is to be packed. The elements can have interlocking projections (12) and recesses (23) to fix same in the package-holding position. One of the elements is preferably a plate. Independent claim describes use of packaging to hold electronic components and equipment such as a notebook which rests on the plate element during assembly following which the other elements are swivelled relative to the plate.
