Abstract (en)
[origin: EP1777356A2] A locking component on a window framework (4) engages a locking hole on a locking device (10) on a window frame (2) when the window framework is in a closed position. A propping component (30) on the window framework engages the locking hole of the locking device when the window framework is in a cleaning position. The window framework is movable relative to the window frame between open and closed positions through a folding framework (6) turnable about an axle (A1). The window framework is tiltable about an axis of rotation between the open position and the cleaning position.
