Abstract (en)

The cooling element has a housing defined underneath by a perforated plate (12) and containing an air chamber (21) which is in air flow connection with a cooling area (24) of the plate which occupies only a part of the surface area of same whilst the remaining area (25) is separated from the air chamber in airtight manner and can be used for noise insulation plates (29) or speakers. The air chamber can be defined by a partition wall of ferromagnetic material to connect through magnets with the perforated plate which is also made of ferromagnetic material. A continuous magnetic strip (18) can contact both the partition and plate.
