Abstract (en)

[origin: US2007266544A1] The invention relates to a rolling installation (100) and a method for its operation known rolling installations (100) typically include a reversing stand (110) for rolling a metal strip (200) in several steps until the metal strip reaches a desired thickness. The reversing stand (110) is usually associated with at least one reversing reel (130) with a reel mandrel (132) for an intermittent storage of the metal strip (200) after separate rolling steps. In addition, the known rolling installations (100) have a sensor device for determining the thickness of the metal strip (200). In order to economically realize a high flexibility when using primary materials having different thicknesses, it is proposed according to the invention, to provide the rolling installation with a winding sleeve exchange device (140) for pushing a winding sleeve (134) onto the reel mandrel (132) before an intermittent storage of the metal strip (200) and for removing the winding sleeve between two rolling steps when the thickness of the metal strip, which is determined by the sensor device (120) is greater than a desired thickness but already smaller than a thickness threshold.
