Abstract (en)

[origin: WO2006016021A1] The invention relates to a container (1) comprising a main shell (2) defining a first chamber containing or used for containing a fluid, in particular for medical use, a pouring device (7) provided with a tubular body (8) which forms a fluid pouring passage, wherein said tubular body is provided with an upstream end (9) fixed to the main shell in such a way that the first chamber is fluidly connectable to the outside of the main shell, a downstream end (10) through which the liquid is dischargeable and a member which closes the pouring device and comprises means (11) for closing the downstream end of the tubular body. Said closure member also comprises a protecting shell (12) which is tightly connectable to the closure means by fixed connecting means (13) and to the main shell (2) by removable connecting means (14).
