Abstract (en)

[origin: WO2006018410A1] The invention relates to a device and a method for identifying the parameters of at least one field device (1) used in automation technology. To simplify the assignment of parameters to field devices in automated systems, the behaviour of the field device is monitored and operating information that describes said field device behaviour is recorded. Said operating information is stored in a first memory area (3), a manufacturer-independent field device model is stored in a second memory area (4) and model parameters (6) belonging to the manufacturer-independent field device model are identified on the basis of the operating information with the aid of a processing unit (5).
