Abstract (en)

[origin: US2008288421A1] Method for digitally franking postal articles during which a digital postage paid impression is generated by a computer and applied to a postal article. Postal article-specific data for one or more postal articles to be created are generated in a first computer at a customer, and the access to a remote second computer at a service provider is granted. Postal article-specific data for one or more postal articles are transmitted to the second computer. The postal article-specific data are processed in the second computer, and data for a digital postage paid impression are generated for each postal article. Afterwards, processing data are transmitted to accounting component, and a deduction of the franking is carried out at the customer. The postal-article specific data are transmitted with a digital postage paid impression for each postal article to be created to the first computer, and the data are recorded in the first computer. The postal article-specific data are then sent to a processor, and the data are printed for each respective postal article, whereupon the printed postal articles are placed in envelopes in the processor.
