Abstract (en)

[origin: WO2006015977A2] The information to be coded is coded by information bit or is recovered by decoding. In each coding step, the actual information bit is combined with a specific number of bits from the XOR code thus arising. During decoding, decisions in the form of a majority decision are taken with regard to the results between specific symbols from demodulation or directly between specific signal sections, preferably using fuzzy XOR operations.
