Abstract (en)

[origin: WO2006027458A1] The invention relates to a system for detecting defects, said system comprising a plurality of magnetic field sensors (24 to 27) that can each generate a field value representative of the magnetic field measured; a module for balancing (34) field values generated according to a pre-established regulation in order to equalise the field values generated in the absence of defects, the pre-established regulation depending on the field values generated in the absence of defects by each of the sensors; and a field generator (40, 41, 42, 43, 46) which is controlled by the balancing module in order to modify the field measured by each of the sensors according to the pre-established regulation.
