Abstract (en)
[origin: WO2006010593A1] The invention relates to a method wherein quality test (QTL) messages are used, in which the physical properties are recorded during the transport, read out, and classified according to the transport process steps. The inventive method comprises the following steps: each QTL message is identified in the nodes; spatiotemporal relations in terms of the nodes passed through are determined; and the logistic process chain followed by each message is automatically determined by means of the process elements from the spatiotemporal relations and the recorded physical states.
