Abstract (en)
The light and warmth control system uses internal and external (7) sensors to detect the presence of a person in the building and adjust natural lighting and solar heating by opening and closing the panels (2, 3) of sliding doors and windows and lowering or raising blinds (5). An internal management module, set according to the requirements of the occupier and adjusted for the season of the year, ensures that warmth and lighting are maintained at the required levels. At the same time, the opening/closing of doors and windows takes into account the level of any external noise and air quality, as well as air temperature and humidity.
