Abstract (en)
[origin: EP1783567A2] The movement has an unlocking lever (45) displaced by a control unit from a rest position towards an active position in which the lever acts on a blocker for liberating seconds counter and includes arms (47, 48). The control unit displaces a zero reset hammer between a rest position and an active position. A spring displaces the lever towards its rest position in response to the cessation of the action of the control unit. An independent claim is also included for a timepiece including a clock movement.
