Abstract (en)
[origin: WO2006027470A2] The simplification/reconstruction processing of an image comprising areas delimited by polygonal lines whose points defining said lines are initially stored in a memory consists in organising sets of remaining points of each line after different initial image simplifications with different simplification ratios in a hierarchical database (SER) and, for processing a reconstruction (33), in using the identifier of the selected simplification ratio for recovering the database of points enabling to reconstruct the image having the selected simplification ratio.
