Abstract (en)

[origin: WO2006003161A1] The invention relates to a container for stacking cards, in particular contactless cards and to a card recycling module provided with said container. The inventive container comprises at least one wall unit (2) in which the cards (1) are stacked, a lift (5) on which the cards are stacked and whose position in the unit (2) is controlled in such a way that a filling distance (dr) between the top of the stack and the top of the unit is maintained constant during filling. The lift (5) position is also controlled in such a way that a discharge distance (dv) between the top of the stack and the top of the unit is maintained constant during discharging. Said invention is usable, for example, for containers which are locatable in access gates for getting back contactless cards at the expiration date thereof and, afterward, are rapidly relocatable in automatic selling or office window equipment.
