Abstract (en)

[origin: EP1785060A1] The lateral guide can be extended from a cabinet body (2) and has a rail (8) connected to a cover inside the body which swivels around a vertical axis (10), and a guide roller (11). The lateral guide has, at a second rail a stop unit (22) which is adjustable. A connection to a retaining arm (25) of a vertical bar (15) is provided. The retaining arm has a connection element (28) so that in different shifting positions, the stop unit along the second rail (14) provides a positive interference between the connecting element (29) of the vertical bar in a longitudinal direction of the second rail.
