Abstract (en)

[origin: EP1785126A2] The bottle (1) has a container with a lateral skirt (4), a base (7) and a neck (5). A nipple (18) is locked on the neck. A valve (26) is mounted in an orifice (17) arranged in the skirt and has an elastically deformable part. The valve has a peripheral groove in which an edge of the orifice is inserted in a tight manner in usage positions of the valve. An air inlet opening crosses the valve in a central zone which permits air from the exterior to the interior of the container in active position and avoids passage of liquid from the interior towards the exterior in rest position of the valve.
