Abstract (en)
[origin: EP1785170A1] The device has a sensor unit (5) provided, where the sensor unit determines a movement condition (19) of the device, where three different movement conditions of the device are determinable with the sensor unit. An evaluation device (7) e.g. microprocessor, determines a movement value (17) from an output signal (6) of the sensor unit, where the movement condition is determinable from the movement value. An independent claim is also included for a method for determining a movement condition of a search and transmission device e.g. avalanche transceiver.
