Abstract (en)

[origin: EP1785963A2] The system has a monitoring device (14), which monitors a person passing a preset escape door security area (15). The escape door security area is provided such that a person should enter into the escape door security area for passing through the escape door in escape direction. The monitoring device activates a local warning signal for deterring the intruded person from actuating the escape door, as long as the person is found in the escape door security area. The device deactivates the signal, when the person leaves the security area. Independent claims are also included for the following: (1) a method for deterring a person from actuating the escape door of the rescue route (2) an application of the monitoring device, in particular a motion detector.
