Abstract (en)

[origin: EP1788143A1] An arrangement for wringing out towelling material comprises two rollers (2,3,4) arranged in parallel and behind one another in a bath (1), a suction unit (12,13,14), and a ventilation pipe (16) connected to it. Each roller has an associated trough shaped heating unit (8,9,10) over a section of its circumference. The last roller has a ventilation line (20) which is connected to an inlet pipe via a throttling unit, and to the ventilation pipe via a bypass line. The inlet pipe feeds air from the last roller back to the chamber. The ventilation line is arranged axially to the side of the last roller.
