Abstract (en)
[origin: EP1788179A2] Actuating device has an actuator which can be movably driven by the reversible motor drive. The actuator engages in a window blind recess, formed in movable part, extending along movement of movable part. The window blind recess has one length, which corresponds to the movement of the carrier between basic position and opening position or partial opening position. The carrier can be moved back with a distribution switchboard, after an adjustment drive of the movable part into open position by the motorized actuator into the basic position.
