Abstract (en)
[origin: WO2006011093A1] The invention provides a container (10) formed of a synthetic plastics material. The container (10) includes a base having a plurality of sides. A side wall (14, 16) is connected to each side of the base (12) via a hinge arrangement for displacement between a collapsed condition, and an erect condition in which the side walls (14, 16) extend upwardly from the base (12) such that at least part of each side wall (14, 16) abuts against the base (12) at a position spaced inwardly from an edge of the base (12). This arrangement ensures that loads are transmitted between the side walls (14, 16) and the base (12) at positions spaced inwardly from the edges of the base (12). The container also includes locking means for locking the side walls in their erect condition. The invention further provides a container blank from which the container can be formed.
