Abstract (en)  
[origin: WO2006029600A1] The invention relates to a mulit-compartment packaging comprising a base part provided with at least two cups (11,12) which are used to receive the components, and a cover film which is connected to the base part. The components can be mixed together by exerting pressure on the connection area between the at least two cups which, as a result, becomes detached. The cover film is made of at least two films (20,30) having different structures. One section or one surface arranged above at least one cup (11) is covered by only one of the two films (20). Due to said selective covering of the base part and/or the components located in the two cups by the films adapted to the user profile of the compartments, the desired physical properties can be adjusted in a separate manner in relation to the density and/or light-impermability for the two cups.
