Abstract (en)
[origin: WO2006031990A1] An actuator cap (60) for a container of product includes a main peripheral wall and a central discharge member axially movable relative to the main peripheral wall (170). The central discharge member is oriented to discharge product substantially axially. A pillar (78) has a peripheral surface, and the pillar (78) is deflectable relative to the main peripheral wall (170) in a direction toward the central discharge member. Movement of the pillar is communicated to the central discharge member to displace the central discharge member when the pillar (78) is deflected.
