Abstract (en)

[origin: EP1790507A1] The device (10) has a longitudinally extending heat exchanger body (12) that is positioned in an air guiding housing, such that longitudinally extending direction of the body is transverse to an air flow direction. A set of heat transmission ribs (38) extend from the heat exchanger body, and are arranged parallel to each other. A surface-enlarging component (42) is provided in an intermediate space (40) that is formed between the ribs. The component has a surface extending unit that stays in heat transmission contact with one of the ribs. An independent claim is also included for a device for conditioning of air that is discharged into a passenger compartment of a vehicle.
