Abstract (en)

Repairing a component (1) made from a super alloy, e.g. turbine blade, comprises providing the site to be repaired with a solder material, heating the site until the solder material melts and allowing the solder material to solidify. The solder material is a powder mixture which corresponds to the composition of the alloy of the component and comprises an elemental powder of the alloy of the component and/or a pre-alloy of the alloy of the component. An independent claim is also included for a solder material for soldering a component.
