Abstract (en)  
Window or facade system has a border (113) which is formed in such a manner, that they are deformed opposite to main part (111) of the infill (110) due to an explosion-caused pressure wave (D), or by break off in such a manner that the main part of infill remains intact and altogether is displaced in disperse direction of pressure wave. A retaining device (130) is provided whereby the displacement of main part of infill is limited after formation of pressure discharge cross section between internal zone (I) and external zone (A) of the building.
