Abstract (en)

The hammer has a zero reset lever (5) mounted on a chronograph movement in a manner to move with respect to the chronograph movement, and a part (17) including two bearing surfaces (18, 19) cooperating with heart-cams of the movement. The lever and the part are connected together to permit a limited displacement with respect to each other. A protrusion (14) of the lever is connected to an undercut (24) of the part (17) through a knuckle type joint. An independent claim is also included for a clock movement including a zero reset hammer.
