Abstract (en)

[origin: WO2006027199A1] The invention relates to a device for connecting a tubular part (2) provided with a tip (4) on a first end and connecting means on a second end for connecting the inside of the tubular part (2) to a syringe (18), to the inside of a bottle comprising a neck (8) provided with a stopper (6) that can be perforated by the tip (4) of the tubular part (2). The inventive device is also provided with supporting means for supporting the device on the neck (8) of the bottle in a tight and essentially central manner. A tight, deformable membrane with two edges is used to hold the tubular part (2) in the perforation direction of the tip (4) in a displaceable manner, one of said edges being tightly connected to the tubular part and the other edge being tightly connected to the supporting means. The membrane can be formed by a deformable tube part (20).
