Abstract (en)

[origin: WO2006028460A2] A system to perform localized activity with respect to digital data includes an interface component and an activity component. The interface component is configured to receive a marker location with respect to source digital data. The activity component is configured automatically to perform a parametrically-controlled activity with respect to the source digital data, based on an activity parameter. The activity component is further configured automatically to perform a parametrically-controlled selection of a selected portion of the source digital data, based on the marker location and a portion selection parameter, and to localize an effect of the parametrically-controlled activity to the selected portion of the source digital data.
