Abstract (en)

[origin: WO2006032751A1] The inventive method for evaluating the efficiency of a noise reducing function is used for audio signals and comprises a preliminary stage for obtaining a predefined test audio signal $X[m]$ containing a useful noise-free signal, a noisy signal $X_b[m]$ obtainable by adding a predefined noisy signal to the test signal $X[m]$ and a processed signal $Y[m]$ obtainable by applying a noise reducing function to the noisy signal $X_b[m]$. Said method is characterised in that it comprises a stage (E3, E4) for measuring loudness of the entire frames m of said $X[m]$, $X_b[m]$ and $Y[m]$ signals or the part thereof.
