Abstract (en)

[origin: EP1792859A2] The method involves providing a new reel (7) that carries a new material sheet (6) in a main winding position (H), and coupling a primary drive (4). An initiation of the material sheet is detached by an aiding device in a certain breadth from the reel. A reel (3) is lagged by a secondary drive (9) until downtime. A stationary material sheet (2) is cut through in a roll winding device (1). The new material sheet delivered from the new reel is inserted by the aiding device in the winding device. The new material sheet delivered from the new reel is initiated in the winding device.
