Abstract (en)

This invention consists of an "articulated mounting system for doors with limited space" that consists of introducing, between a conventional door and the frame or surface to be covered, a solid intermediary provided with angular displacement around a resting axis located in the frame, wall or any surface that supports the door and which, at its other end, contains the turning axis for the door located on its own symmetrical axis, incorporating a horizontal handle in the turning axis of the door itself and around one of its faces, which allows the user to force the movement of the whole thing and to move it in a parallel fashion to the surface of the door until they can enter or exit without difficulty.
