Abstract (en)

[origin: WO2006035140A1] The invention relates to a method for detecting the unauthorised connection to a wireless network. A passive radio listening (101) makes it possible to retrieve exchanged frames. Specific frames identifying the access points are stored (104). When two frames coming from the same access point are recorded, types of time information are compared (105). When the difference between types of time information does not correspond to a desired value, the unauthorised connection is detected.
