Abstract (en)

The slide has an actuator component (29) adjustably supported between a release position and a locking position for releasing and locking hangings of a center rail (2) from a body rail (1) and inserts of the center rail into the body rail. The center rail is tilted in an unblocking position of the component opposite to the body rail. Stopper units of the center rail and the body rail are directed to each other in the tilting position of the center rail. The tilting of the center rail is blocked from its normal position into its tilting position, in a locking position of the component.
