Abstract (en)

[origin: EP1795732A1] The exchanger has parallel pipes arranged inside a casing, through which gases flow to be cooled by thermal exchange with a refrigeration fluid. The pipes are connected between two support plates (7) anchored at both ends of the casing, where the casing and the support plates have a substantially rectangular cross-section. Each support plate includes protuberances arranged in proximity to a peripheral zone, where the protuberances (9) includes raised portions that come into contact with a peripheral surface area of the casing.
