Abstract (en)

[origin: US2007133344A1] The invention relates to a household appliance with an electric control system ( 20 ), which is connected to an accessory part ( 12 ) for the household appliance in a signal-transmitting fashion, wherein the accessory part ( 12 ) can be moved back and forth between an active position and a resting position on the household appliance and, in the switched-on state of the household appliance, exchanges signals for controlling the household appliance with the electric control system ( 20 ), at least in the active position. In order to specify a household appliance in which the accessory part, in its resting position, is stored in the household appliance in such a way that the user can access the household appliance without obstruction and, at the same time, a high degree of security against malfunction is guaranteed, the signal exchange between the transmission or transmission/reception device ( 17 ) of the accessory part ( 12 ) and the electric control system ( 20 ) occurs wirelessly and the accessory part ( 12 ), in its resting position, is mounted in a storage element ( 6 ) of the household appliance at least partly consisting of an electrically conductive material, said storage element electrically shielding the transmission or transmission/reception device ( 17 ) of the accessory part ( 12 ) from the electric control system ( 20 ) so that signal exchange is prevented.
