Abstract (en)
A reception part (111) receives RLC-PDU from an RLC processing part to extract information to be used for determining whether security is required. This information is sent to a security management part (114), which determines whether security is required. Data outputted from the reception part (111) is stored into a data buffer (112) via a data management part (116). The data, which is regarded by the security management part (114) as requiring security, is read by the data management part (116) from the data buffer (112), then encrypted by a security calculation part (113), and then stored back into the data buffer (112) again. Concealed or non-concealed data is read from the data buffer (112) and sent to an FP processing part via a transmission part (115).
