Abstract (en)

[origin: WO2006032243A1] The invention relates to a covering device for glazing in a vehicle, particularly a transparent sliding sun roof (12). The device comprises a flat, flexible darkening element (12) which can be pulled out and placed over the glazing (12) of the vehicle. The front end of the darkening element (20), in the direction in which it is pulled out, is connected to a traction element (22) extending perpendicular to said direction. On the end facing away from the traction element (22), the darkening element is firmly connected to the vehicle. The darkening element (20) is also deflected on a tenting element (26) extending perpendicular to the direction in which it is pulled out. Said tenting element (20) is pretensed counter to the direction in which the darkening element is pulled out. In order to prevent undulations and folds from being formed, the darkening element (20) is guided in the lateral edge areas thereof on the tenting element (26).
