Abstract (en)

[origin: DE102005061029B3] The rotary printing process has computer [01] generated image data [02] transmitted to a raster image processor [03] with output stored in a memory [06]. The process is controlled and monitored by a separate computer [08] that is network coupled [09]. Data and control signals are transmitted to the multiple stages of a rotary printing machine system [18] that are identified by addresses defined in a table.
