Abstract (en)

[origin: EP1798321A2] A loom (10) includes a control unit (54) and has operation buttons including a low-speed forward rotation button and a low-speed reverse rotation button. When an abnormal signal (S0) is input while a program for rotating a loom main shaft (42) to a predetermined rotational phase is being executed, the control unit (54) stops the loom main shaft (42), stops the execution of the program, and enables only an operation signal from one of the operation buttons that corresponds to a rotating direction of the loom main shaft (42) that has been set during the execution of the program until the loom main shaft (42) reaches the predetermined rotational phase.
