Abstract (en)

[origin: US2007226942A1] A device for drying and/or wetting a mop with a removable container for receiving a liquid. The device has a receiver for the container with a collecting base which is located underneath the container when the container is disposed in the receiver, and the device has liquid conveying devices for removing or feeding the liquid. The collecting base extends underneath the liquid conveying devices. The liquid conveying devices have a motor for driving a pump for wetting the mop with liquid from the container and for driving a drying device for removing liquid from the mop. The drying device and the motor are fixedly connected to the device and the pump is arranged in the container. The pump is operatively connected to the motor via a separable coupling in a driving manner.
