Abstract (en)

[origin: WO2006034678A1] The invention relates to a method for connecting at least one frame profile (4) to a glass pane (10). Said method is characterized by inserting every frame profile in a device (1) which is configured as a template. Recesses provided in the frame profile are filled with an adhesive (6). The device and the glass pane are displaced in relation to each other in such a manner that the adhesive of the frame profile inserted in the device rests against the glass pane in an aligned manner determined by the device. After a defined curing time of the adhesive, the glass pane equipped with at least one frame profile and the device are separated from each other.
