Abstract (en)
[origin: WO2006040019A1] The invention concerns a dispensing device for storing, preparing and providing containers (12) which are adapted to be filled with a substance sensitive to vapour, gas or powder components of outside atmosphere, and whereof the opening for filling and pouring can be closed to be sealed to outside atmosphere and resist intrusion. The dispensing device comprises a pouring-aid system (10) which can be hermetically fitted into the opening for filling and pouring of the corresponding container (2) The pouring-aid system has a pouring opening (22) whereof the passage cross-section is smaller than that of the opening for filling and pouring of the container (12), and a reception part connected to the inner space of the container when the latter is hermetically sealed, for providing a chemical and/or physical action against the matter containing substances from the outside environment, which are capable of having a harmful effect on the contents of the container.
